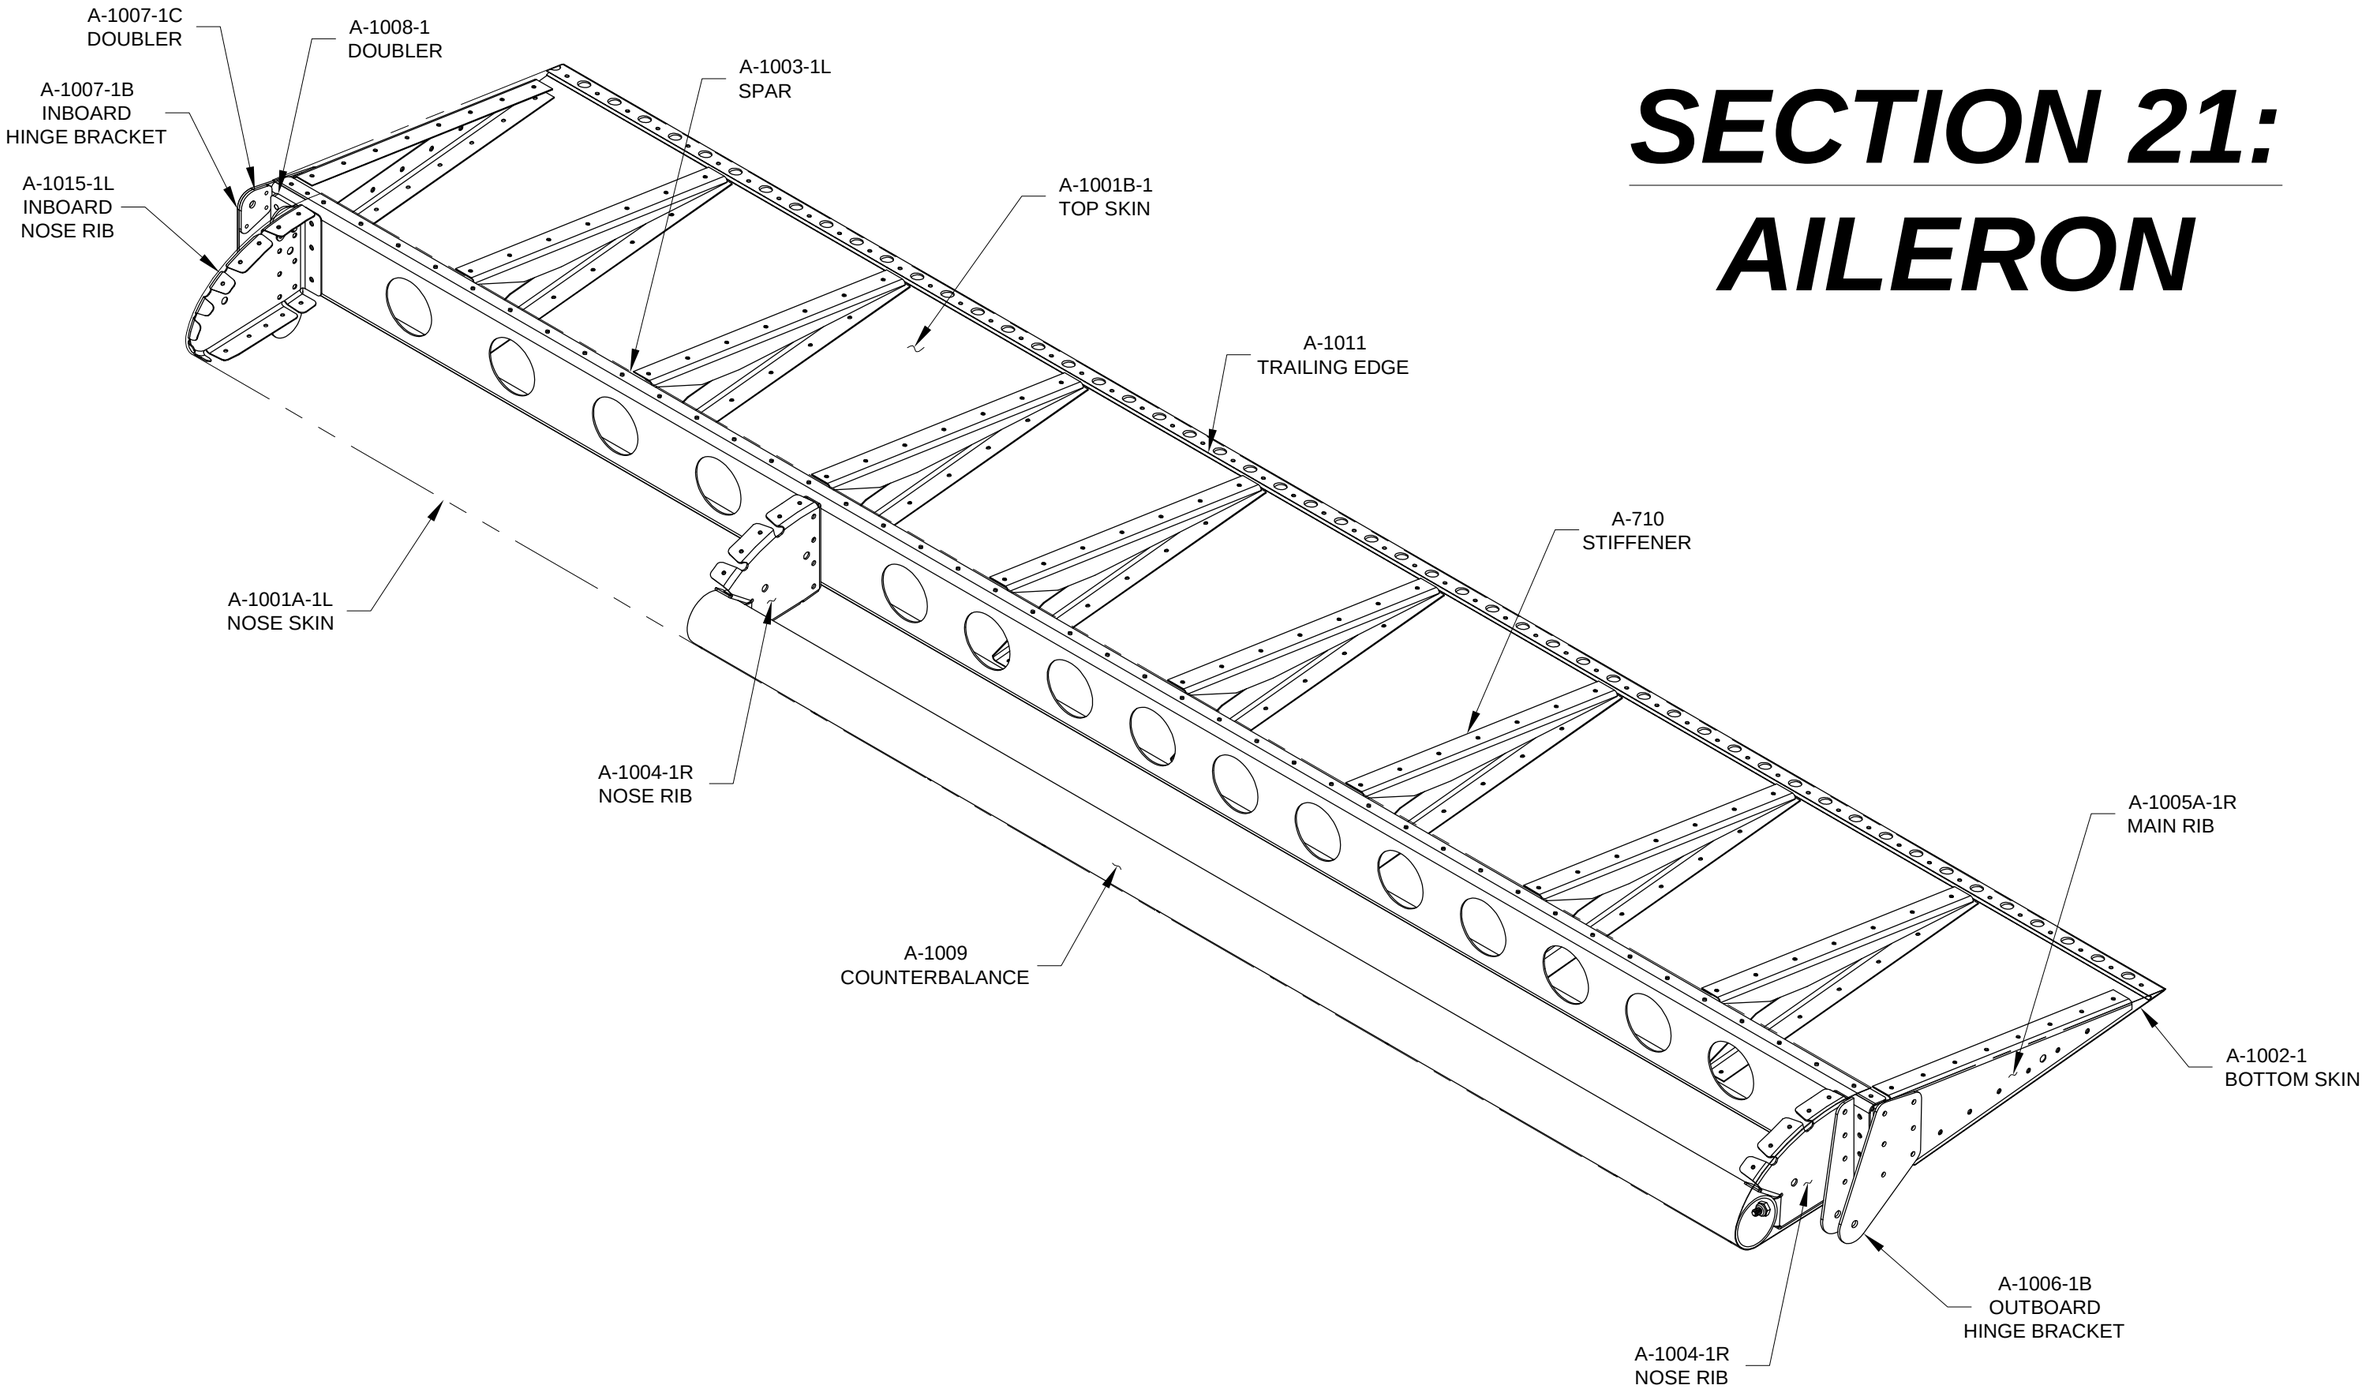
SECTION 21:
AILERON



DATE OF COMPLETION: _____
PARTICIPANTS: _____

Step 1: Separate the A-1006-1 Outboard Hinge Brackets into parts A and B. Separate A-1007-1 Inboard Hinge Brackets into parts A, B, and C. See Figure 1.

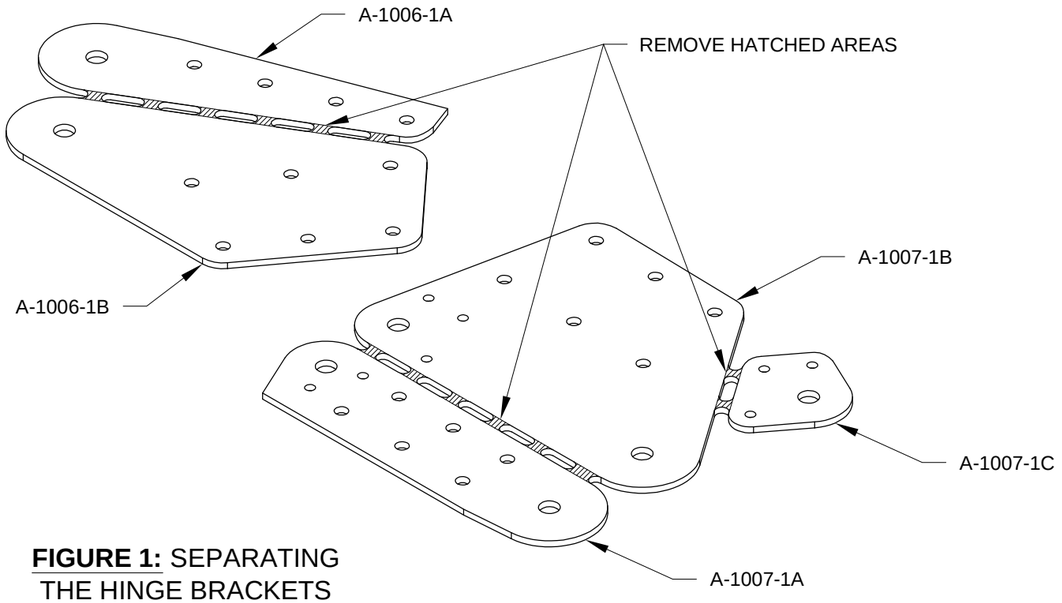


FIGURE 1: SEPARATING THE HINGE BRACKETS

Step 2: Flute and straighten as required to adjust the flanges of the A-1004-1L and A-1004-1R Nose Ribs and A-1015-1L and A-1015-1R Inboard Nose Ribs to 90°.

Final-Drill #40, deburr and dimple all the holes in the flanged of the nose ribs and inboard nose ribs.

Step 3: Buff the edges of the A-1015-1L and A-1015-1R Inboard Nose Rib flanges as shown in Figure 2 on an abrasive wheel in order to minimize the tendency for them to appear faceted instead of curved.

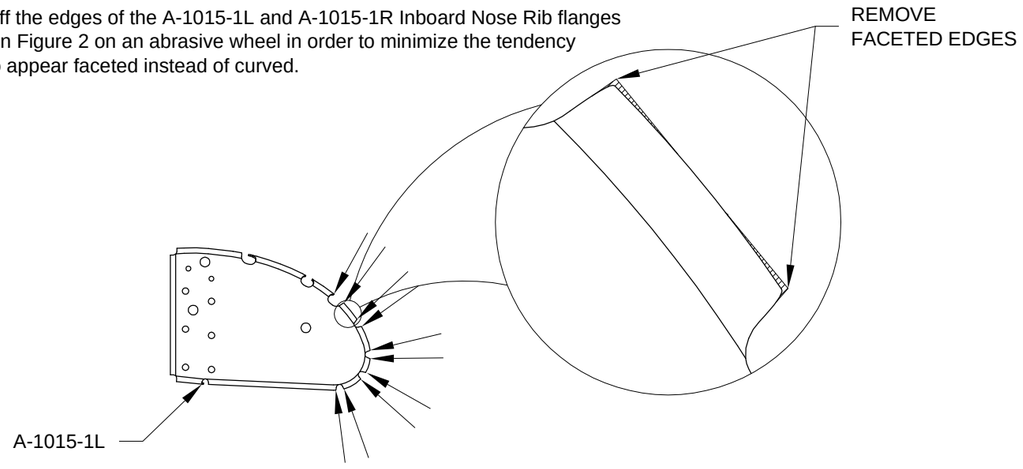

FIGURE 2: BUFF FLANGE EDGES

Step 4: Final-Drill #30 the .129 [3.3 mm] holes common to the A-1006-1A Outboard Hinge Brackets and the A-1004-1R and A-1004-1L Nose Ribs. Machine countersink the outboard hinge brackets for the head of a AN426AD4 rivet as shown in Figure 3. Deburr the outboard hinge brackets and the A-1004-1R and A-1004-1L Nose Ribs.

Step 5: Final-Drill #30 the .129 [3.3 mm] holes common to the A-1007-1A Inboard Hinge Brackets and the A-1015-1L and A-1015-1R Ribs. Final-Drill #12 the bolt holes in the inboard hinge brackets and ribs. Machine countersink the inboard hinge bracket and deburr. See Figure 4.

Step 6: Attach the A-1006-1A Outboard Hinge Brackets to the A-1004-1R and A-1004-1L Nose Ribs with the rivets called out in Figure 3.

Step 7: Rivet the A-1007-1A Inboard Hinge Brackets to the A-1015-1L and A-1015-1R Ribs with the rivets called out in Figure 4. Install the nutplates called out in Figure 4.

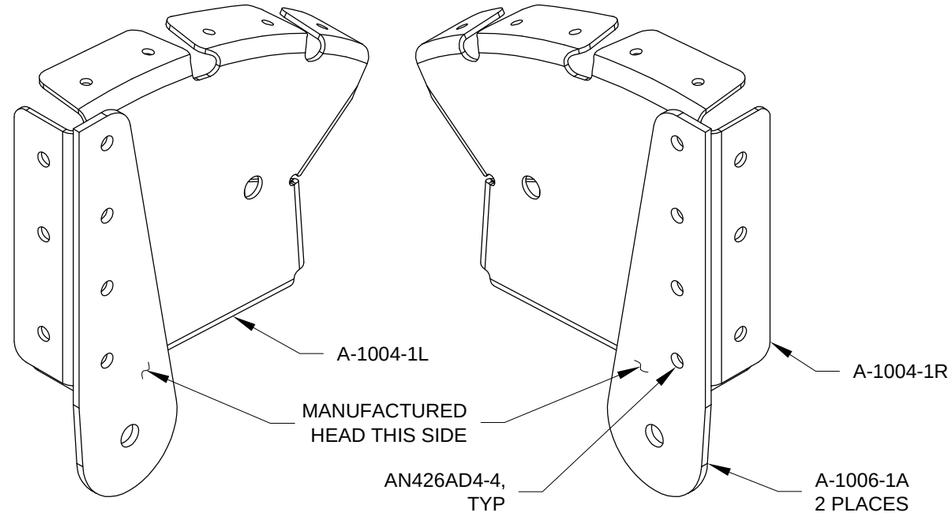

FIGURE 3: OUTBOARD HINGE BRACKET TO NOSE RIB INSTALLATION

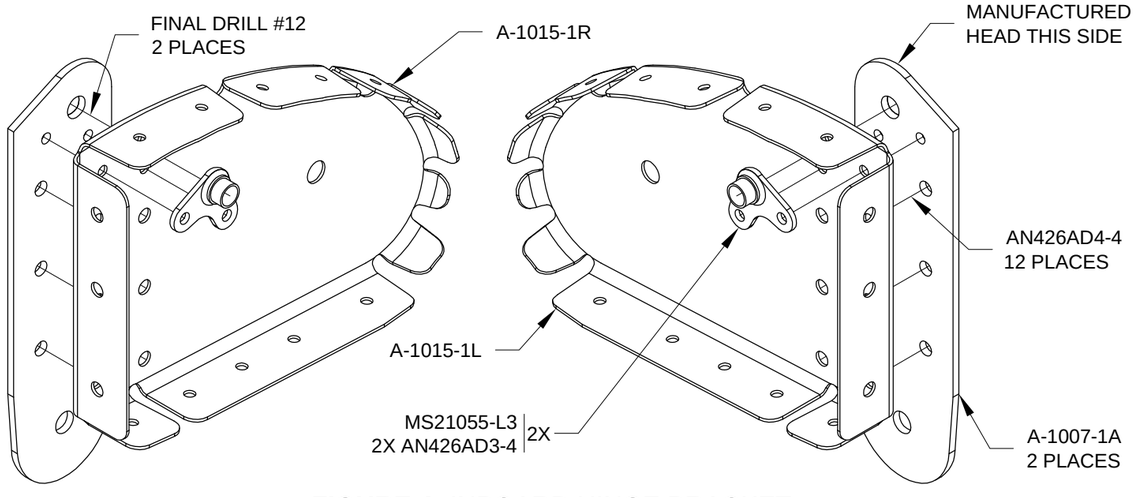

FIGURE 4: INBOARD HINGE BRACKET TO NOSE RIB INSTALLATION

Step 1: Separate the A-1005-1L Main Ribs into A-1005-1A-L and A-1005-1B-L.

Separate the A-1005-1R Main Ribs into A-1005-1A-R and A-1005-1B-R. See Figure 1.

Dimple the .098 [2.5 mm] holes in the main ribs.

Step 2: Deburr the A-1005-1A-L and A-1005-1A-R Main Ribs and the A-1005-1B-L and A-1005-1B-R Main Ribs.

Deburr the A-1006-1B Outboard Hinge Brackets, A-1007-1B and A-1007-1C Inboard Hinge Brackets.

Step 3: Machine countersink the .129 [3.3 mm] holes in the A-1006-1B Outboard Hinge Brackets and A-1007-1B Inboard Hinge Brackets to fit the head of an AN426AD4 rivet. See Figures 2, 4, and 5.

Parts for the right aileron must be countersunk on the side opposite that shown in Figures 2, 4, and 5.

Step 4: Cleco the A-1007-1B and A-1007-1C Inboard Hinge Brackets to each other. Final-Drill #12 the .188 [4.8 mm] hole and machine countersink for the head of an AN509-10 countersunk screw. See Figure 2.

Machine countersink the .098 [2.5 mm] holes in the A-1007-1B Inboard Hinge Bracket to fit the head of an AN426AD3 rivet as shown in Figures 2 and 4.

Parts for the right aileron must be countersunk on the side opposite that shown in Figures 2, 4, and 5.

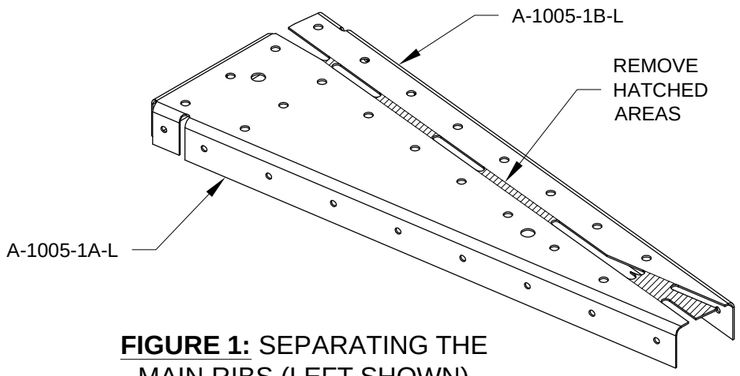

FIGURE 1: SEPARATING THE MAIN RIBS (LEFT SHOWN)

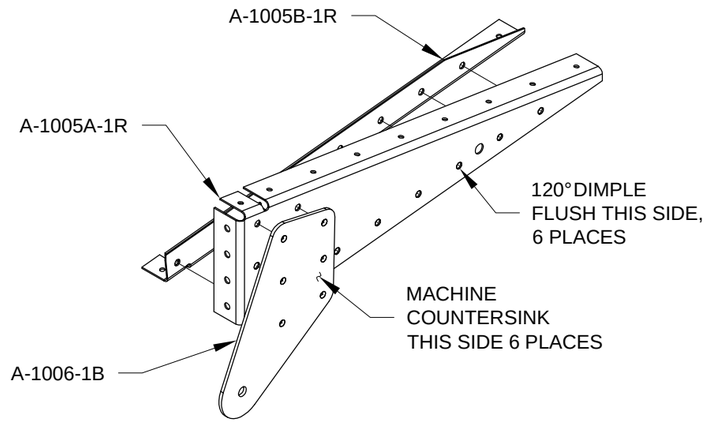

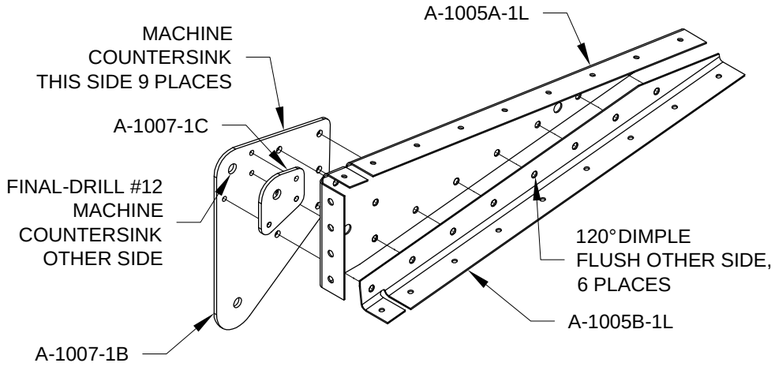

FIGURE 2: MACHINE COUNTERSINK MAIN RIBS AND HINGE BRACKETS

Step 5: Machine countersink the A-1008-1 Doubler for the head of AN426AD3 rivets as shown in Figure 3.

Removed the hatched areas on the doubler as shown in Figure 3 to make 2 parts.

Step 6: Prime all A-1005A-1, A-1005B-1, A-1006-1, A-1007-1, and A-1008-1 parts

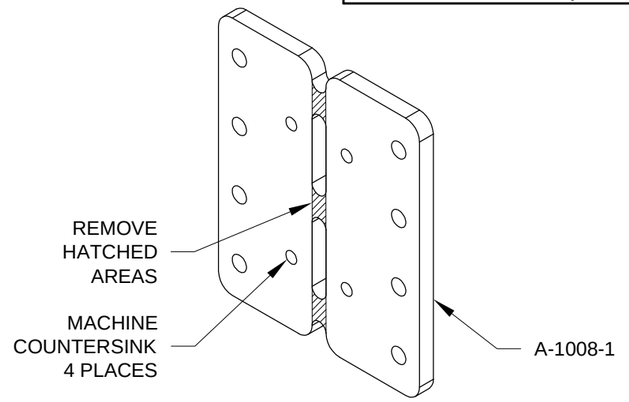

FIGURE 3: SEPARATING THE DOUBLERS

Step 7: Cleco then rivet the A-1007-1B and A-1007-1C Inboard Hinge Brackets to the A-1005A-1L and A-1005A-1R Main Ribs. Leave open the 2 bottom holes as noted in Figure 4.

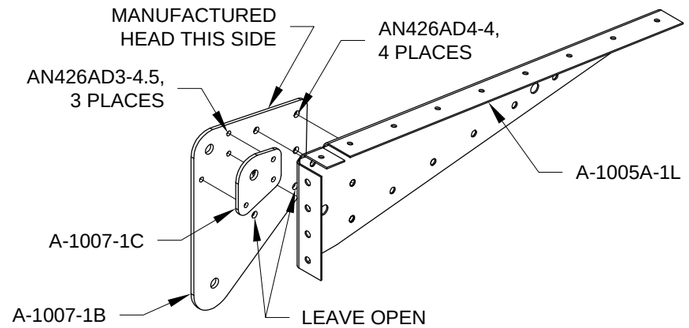

FIGURE 4: INBOARD HINGE BRACKET ATTACH

Step 8: Cleco then rivet the A-1006-1B Outboard Hinge Brackets to the A-1005A-1L and A-1005A-1R Main Ribs. Leave open the 2 bottom holes as noted in Figure 5.

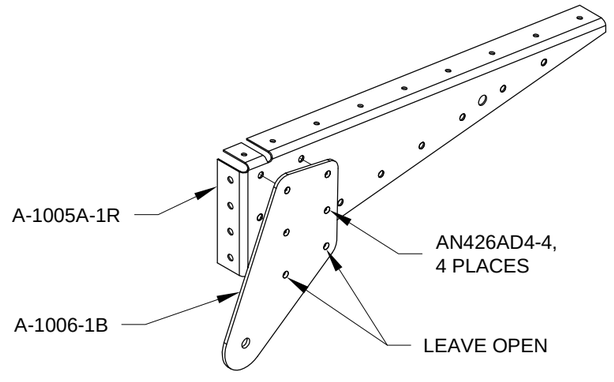

FIGURE 5: OUTBOARD HINGE BRACKET ATTACH

NOTE: The construction technique for the ailerons is similar to that of the rudder and elevators. The aileron uses ribs at the ends only while light angle stiffeners support the rest of the skin. The aileron must be kept flat while drilling and riveting. A cradle to hold the aileron in a vertical position while riveting is required. Since the aileron has a thinner cross section than the flap, make the cradle using the FL-1004-L Flap Nose Rib as shown in the flap assembly manual Page 2, Figure 1. The cradle need not be a perfect fit for the aileron. It is intended mainly as a support for holding the aileron in a position suitable for riveting.

Assembly instructions are for the Left Aileron Assembly. The Right Aileron Assembly is a mirror of the Left. The builder may choose to complete all steps for the left side before repeating those steps for the right side or to complete each step for both left and right sides before moving to the next step.

Step 1: Cleco the A-1004-1R Nose Ribs to the A-1003-1L Spar. See Figure 1. Cleco the A-1015-1L Inboard Nose Rib and A-1008-1 Doubler to the spar.

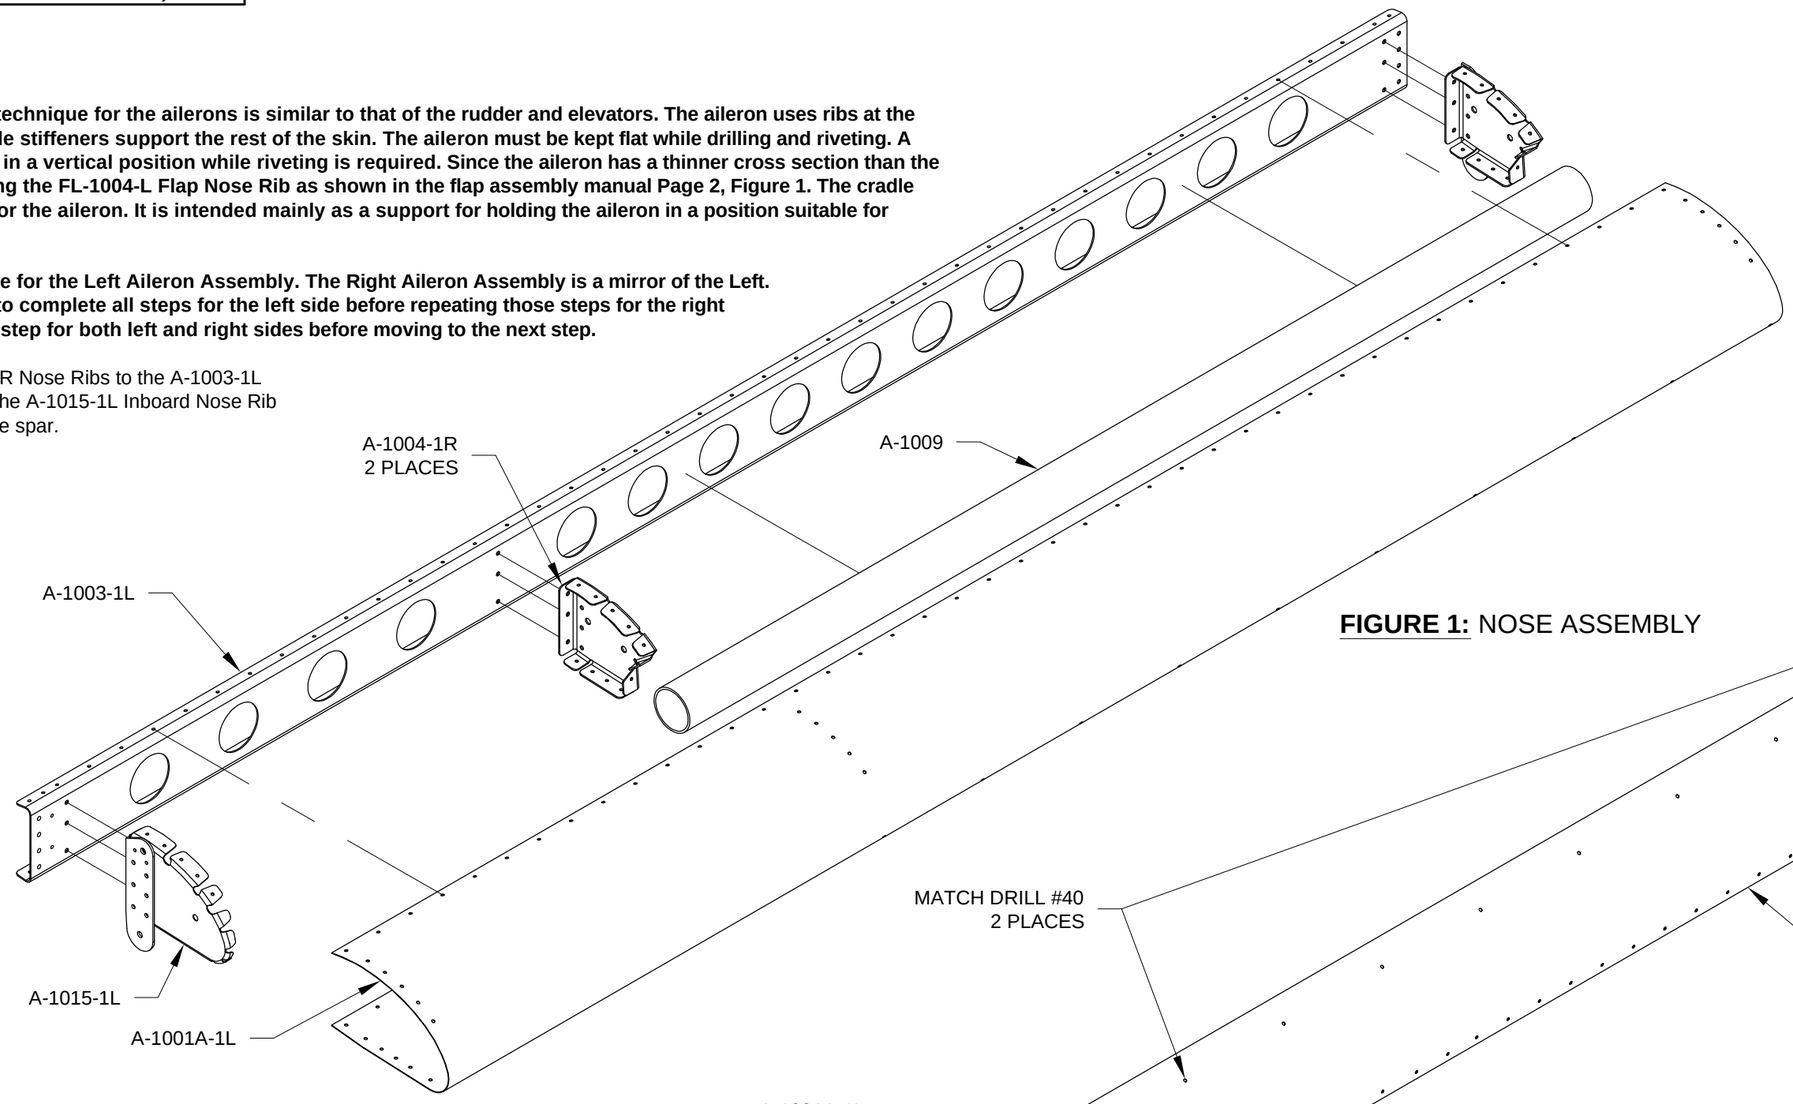

FIGURE 1: NOSE ASSEMBLY

Step 2: Cut ST304-065X1.375X46 Steel Tube to 34.625 [879.5 mm] to make the A-1009 Counterbalance.

Step 3: Cleco the A-1001A-1L Nose Skin to the lower flange of the A-1003-1L Spar at every third hole. Lay the A-1009 Counterbalance into the nose skin so that it is flush with the outboard edge of the nose skin. Cleco the nose skin to the top flange of the spar at every third hole applying downward pressure on the nose skin if/as required to insert the clecos. Cleco the nose skin to the A-1004-1R Nose Ribs and to the A-1015-1L Inboard Nose Rib as shown in Figure 1. Place the assembly leading edge up onto a narrow table or blocks as shown in Figure 2.

Step 4: Match-Drill #40 the most outboard hole and most inboard hole of the A-1001A-1L Nose Skin into the A-1009 Aileron Counterbalance. See "match-drill" call-outs in Figure 2.

Remove the nose skin.

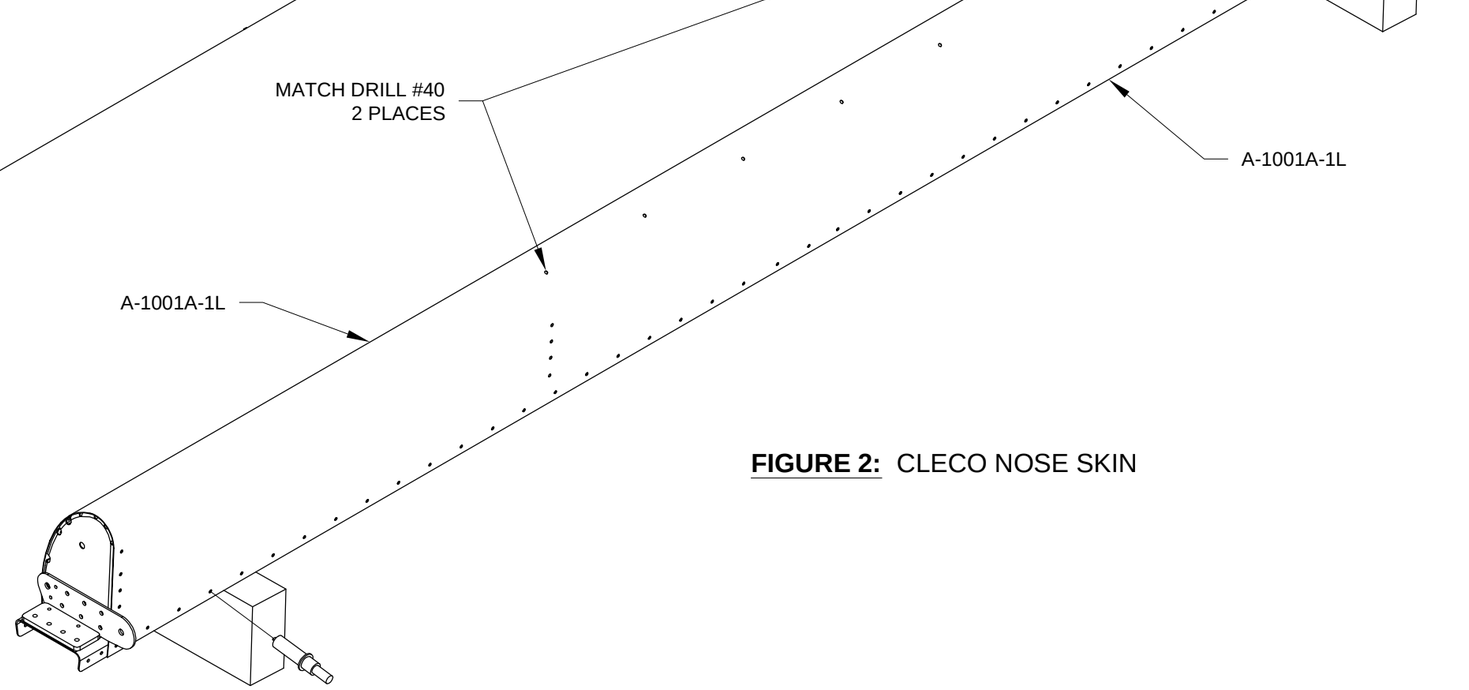

FIGURE 2: CLECO NOSE SKIN

Step 1: Cleco the A-1009 Counterbalance to the A-1004-1R Nose Ribs as shown in Figure 1.

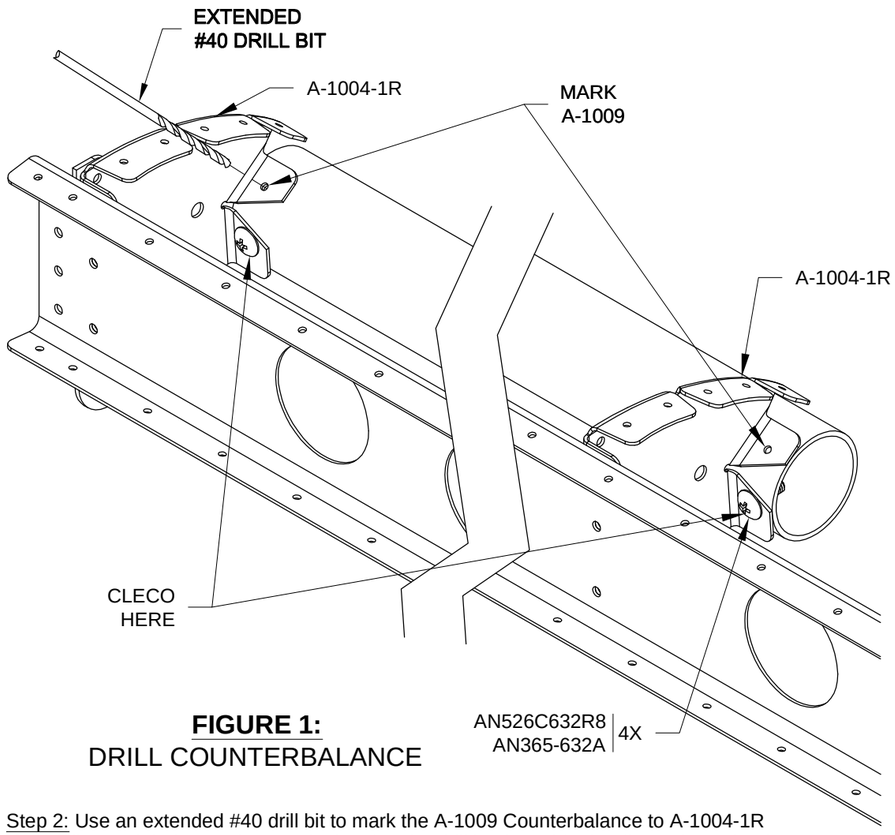

FIGURE 1:
DRILL COUNTERBALANCE

Step 2: Use an extended #40 drill bit to mark the A-1009 Counterbalance to A-1004-1R Nose Rib attach holes on the spar by leaning the drill in alongside the rib as shown in Figure 1.

Remove the counterbalance. Final-Drill #27 the marked holes and the two #40 holes in the counterbalance. Final-Drill #27 the four corresponding holes in the nose ribs.

Attach the counter balance to the nose ribs using the hardware called out in Figure 1. If you have difficulty getting a screwdriver on the head of the screw use an offset screwdriver or a Phillips bit tip held in Vise-Grip pliers at 90°.

Step 3: Cleco the A-1001A-1L Nose Skin to the A-1004-1R Nose Ribs, A-1015-1L Inboard Nose Rib, and A-1003-1L Spar. Match-Drill #40 into the counterbalance along its length using the holes in the leading edge of the nose skin as drill guides. Start drilling at one end. Insert a cleco after each hole is drilled to prevent the counterbalance from being pushed away from the skin. Go back through and final-drill #30 these same holes. See Page 21-04, Figure 2 for hole locations.

Step 4: Remove the A-1001A-1L Nose Skin.

Remove the A-1004-1R Nose Ribs and A-1015-1L Inboard Nose Rib from the spar.

Step 5: Final-Drill #40 all the .094 [2.4 mm] holes in the A-710 Stiffeners. Cut the stiffeners from the angle strip provided and trim as shown in Figure 2. The angle strip is shown unbent for clarity.

CAUTION: Be careful to dimple the skins in the correct direction.

NOTE: If electing to prime, leave the skins unprimed in the area where they will contact the A-1011 Trailing Edge because adhesive will be applied.

Step 5: Deburr and dimple the holes common to the A-710 Stiffeners, the A-1005A-1L, A-1005A-1R, A-1005B-1L and A-1005B-1R Main Ribs and the A-1001B-1 Top Skins and A-1002-1 Bottom Skins as shown in Figure 3.

Step 6: Prime the the A-1001B-1 Top Skins, A-1002-1 Bottom Skins, and A-710 Stiffeners.

Step 7: Rivet the A-710 Stiffeners, the A-1005A-1L and A-1005A-1R Main Ribs, and the A-1005B-1L and A-1005B-1R Main Ribs to the A-1001B-1 Top Skin and A-1002-1 Bottom Skin using the back-riveting method described in Section 5F.

See Page 21-10, Figures 3 and 4 for rivet call outs.

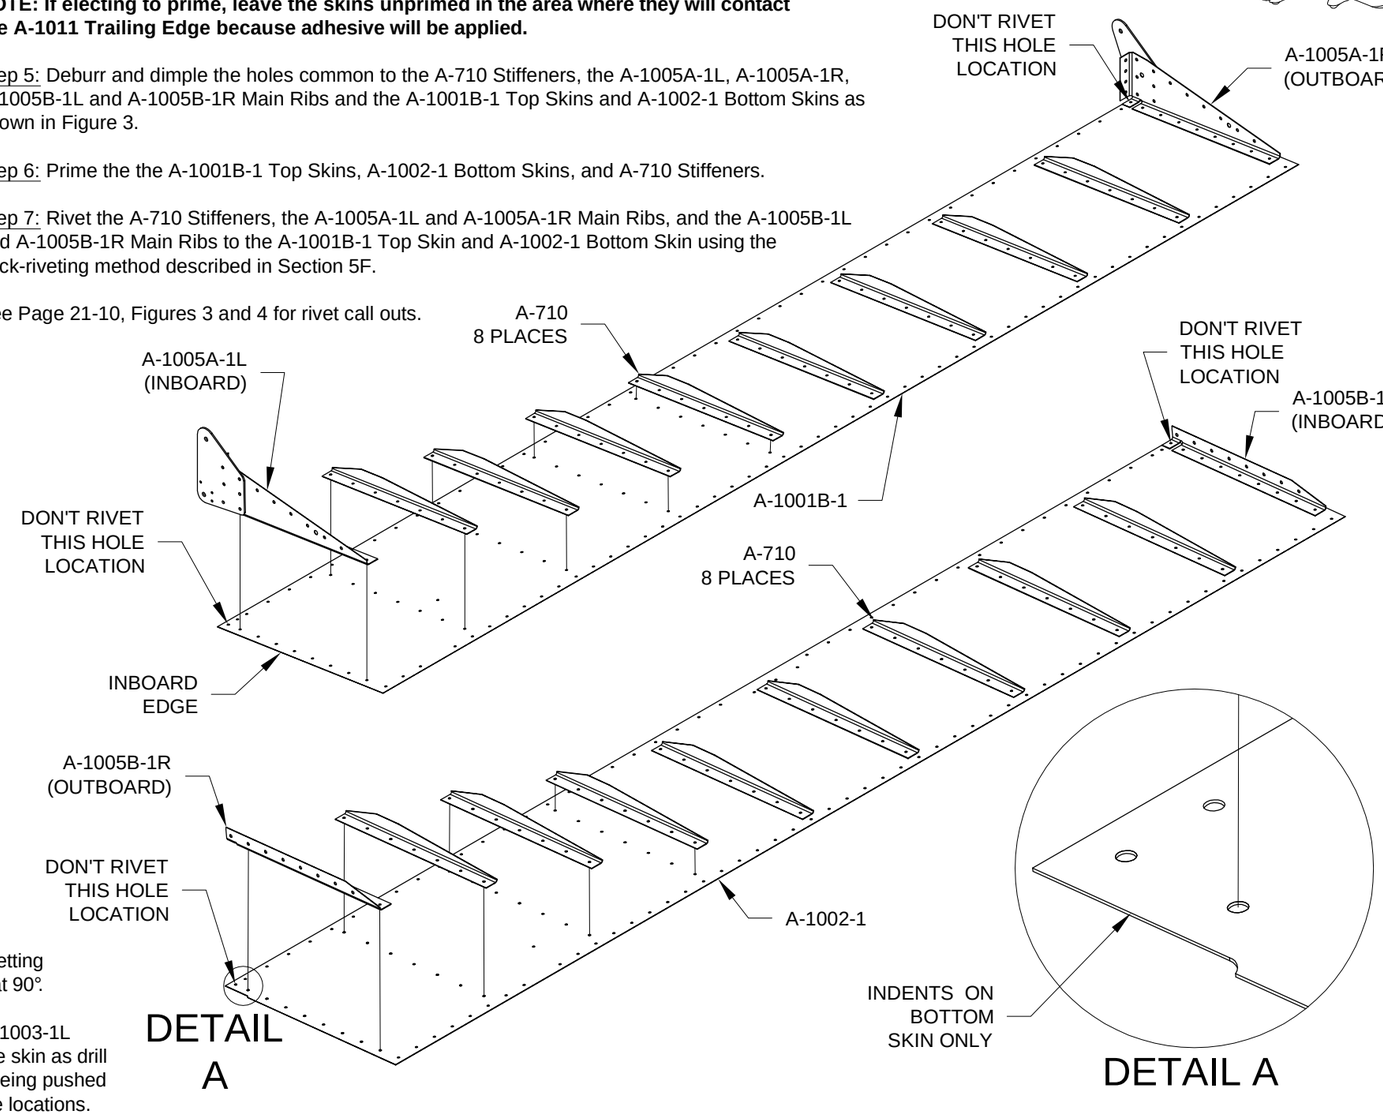

FIGURE 3: ATTACHING STIFFENERS AND MAIN RIBS TO SKINS

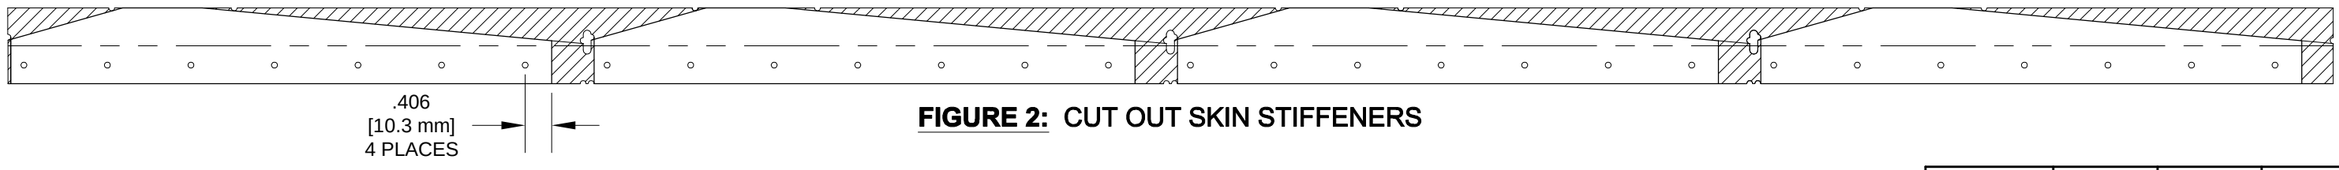

FIGURE 2: CUT OUT SKIN STIFFENERS

Step 1: Cleco the top skin assembly and the A-1001A-1L Nose Skin to the top flange of the spar at every other hole. Cleco the nose skin to the A-1004-1R Nose Ribs, and A-1015-1L Inboard Nose Rib.

Cleco the A-1005-1A-L and A-1005-1A-R Main Ribs to the spar.

Cleco the bottom skin assembly to the spar assembly and cleco the A-1005-1B-L and A-1005-1B-R Main Ribs to the top skin and spar assemblies.

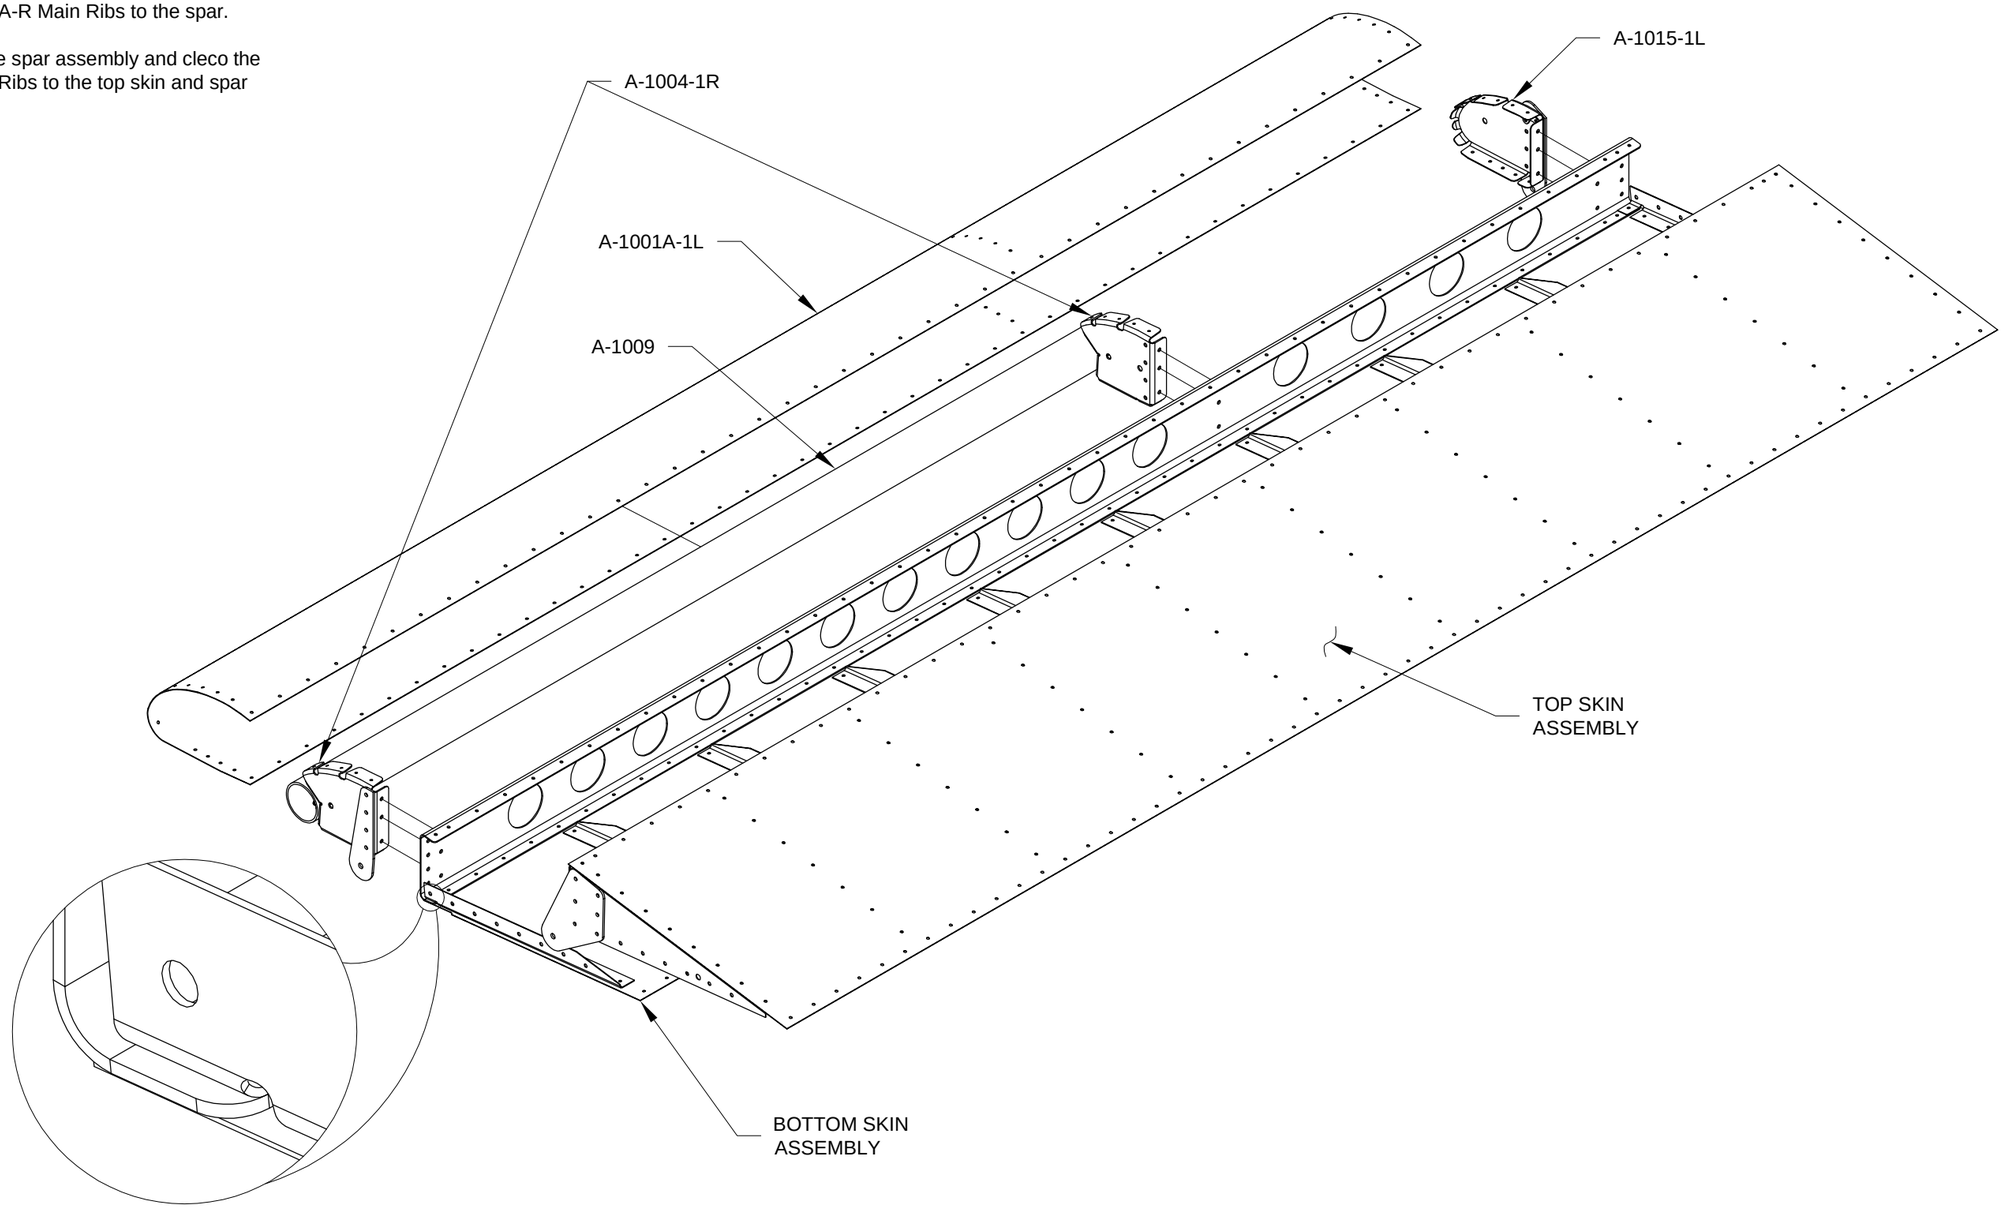

FIGURE 1: FITTING ASSEMBLY

Step 1: Lay the assembly flat on the table top hanging the clecos which are holding the A-1001A-1L Nose Skin to the A-1002-1 Bottom Skin and A-1003-1L Spar over the edge. Use weights over the main ribs to keep it firmly against the table with no twist. A straight board can be used to distribute the weight and hold the aileron flat to the table. See Figure 1.

Step 2: Check the A-1001A-1 Nose Skin for bowing with a straight edge held spanwise midway between the the leading edge and spar. About .063 [1.6 mm] of rise is acceptable. If necessary the skin can be squeezed down by hand to minimize the bow.

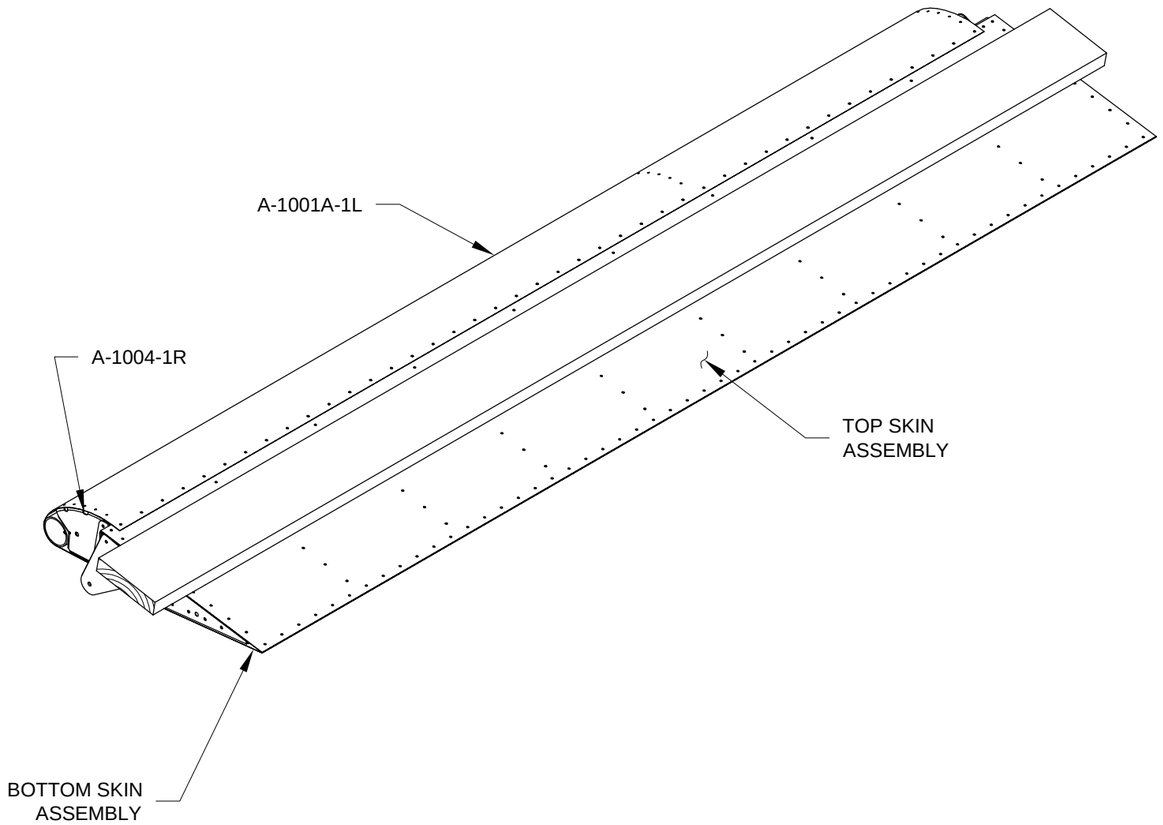

FIGURE 1: FINAL-DRILL SPAR AND NOSE RIBS

Note: Drill perpendicular to the centerline of the extrusion, not the surface of the top skin. The difference is only a few degrees, but using the correct reference will give better results.

Step 3: Cleco the A-1011 Trailing Edge, made from VA-140 Trailing Edge Extrusion, into the aileron's trailing edge. Mark the inboard and outboard ends of the trailing edge where the edge of the top skin assembly meets the trailing edge. See Figure 2.

Final-Drill #40 the holes common to the top skin and bottom skin assemblies and trailing edge.

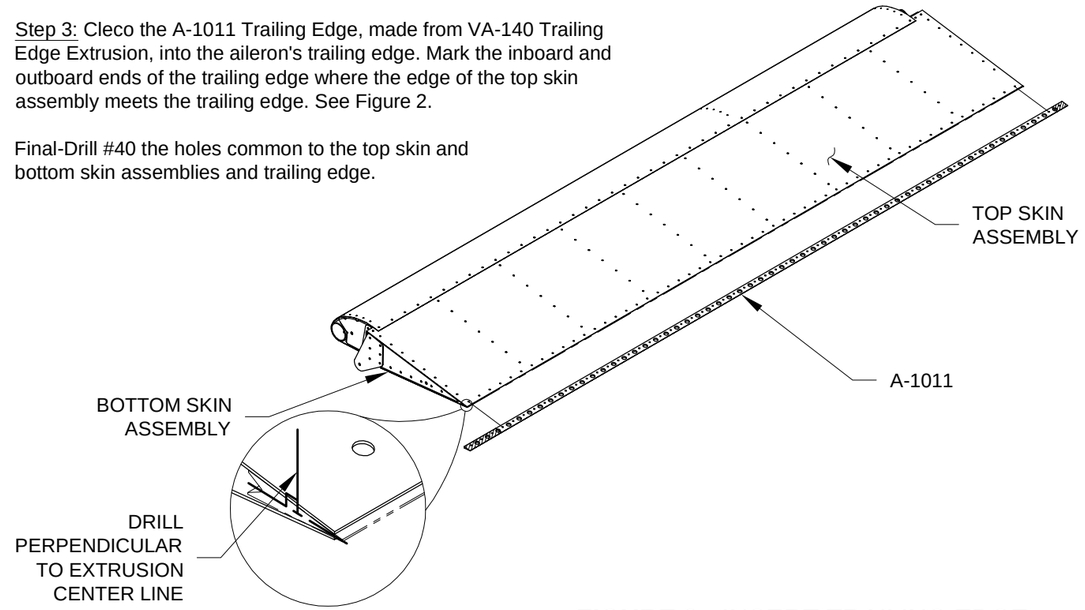

FIGURE 2: INSERT TRAILING EDGE

Step 4: Disassemble the aileron. Deburr all the parts including the insides of the lightening holes in the A-1003-1L Spar.

Trim the A-1011 Trailing Edge at the marks made on the inboard and outboard locations as marked in Step 3.

Step 5: Make a edge break in the aft edge of the A-1001A-1L Leading Edge, A-1001B-1 Top Skin, and A-1002-1 Bottom Skin (see Section 5K).

Step 6: With the exception of the A-1011 Trailing Edge, dimple wherever exterior flush rivets will be installed, including the spar flanges. Since the spar is .040 thick it may bow slightly when dimpled but it will straighten during final assembly.

Machine countersink the holes in the trailing edge with the tool perpendicular to the surface of the part.

Dimple all remaining holes in the skins.

If electing to prime, note that the A-1009 Counterbalance is stainless steel and need not be primed. The A-1011 Trailing Edge should not be primed because adhesive will be applied.

Step 7: Rivet the A-1008-1 Doubler to the A-1003-1L Spar using the rivets called out in Figure 3.

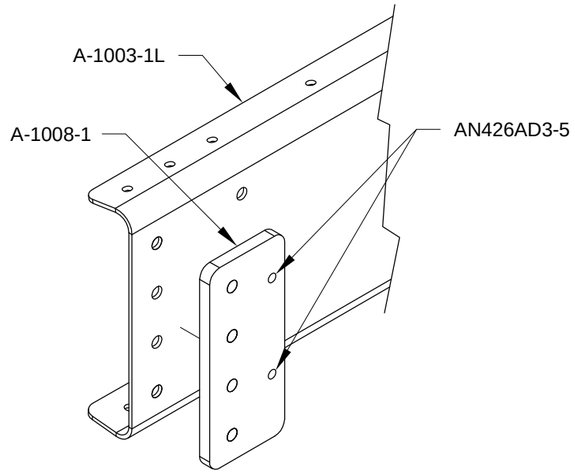

FIGURE 3: ATTACHING THE DOUBLER TO THE SPAR

Step 1: Cleco the nose rib/counterbalance subassembly and the A-1015-1L Inboard Nose Rib into the A-1001A-1L Nose Skin by installing clecos into the counterbalance and all nose ribs.

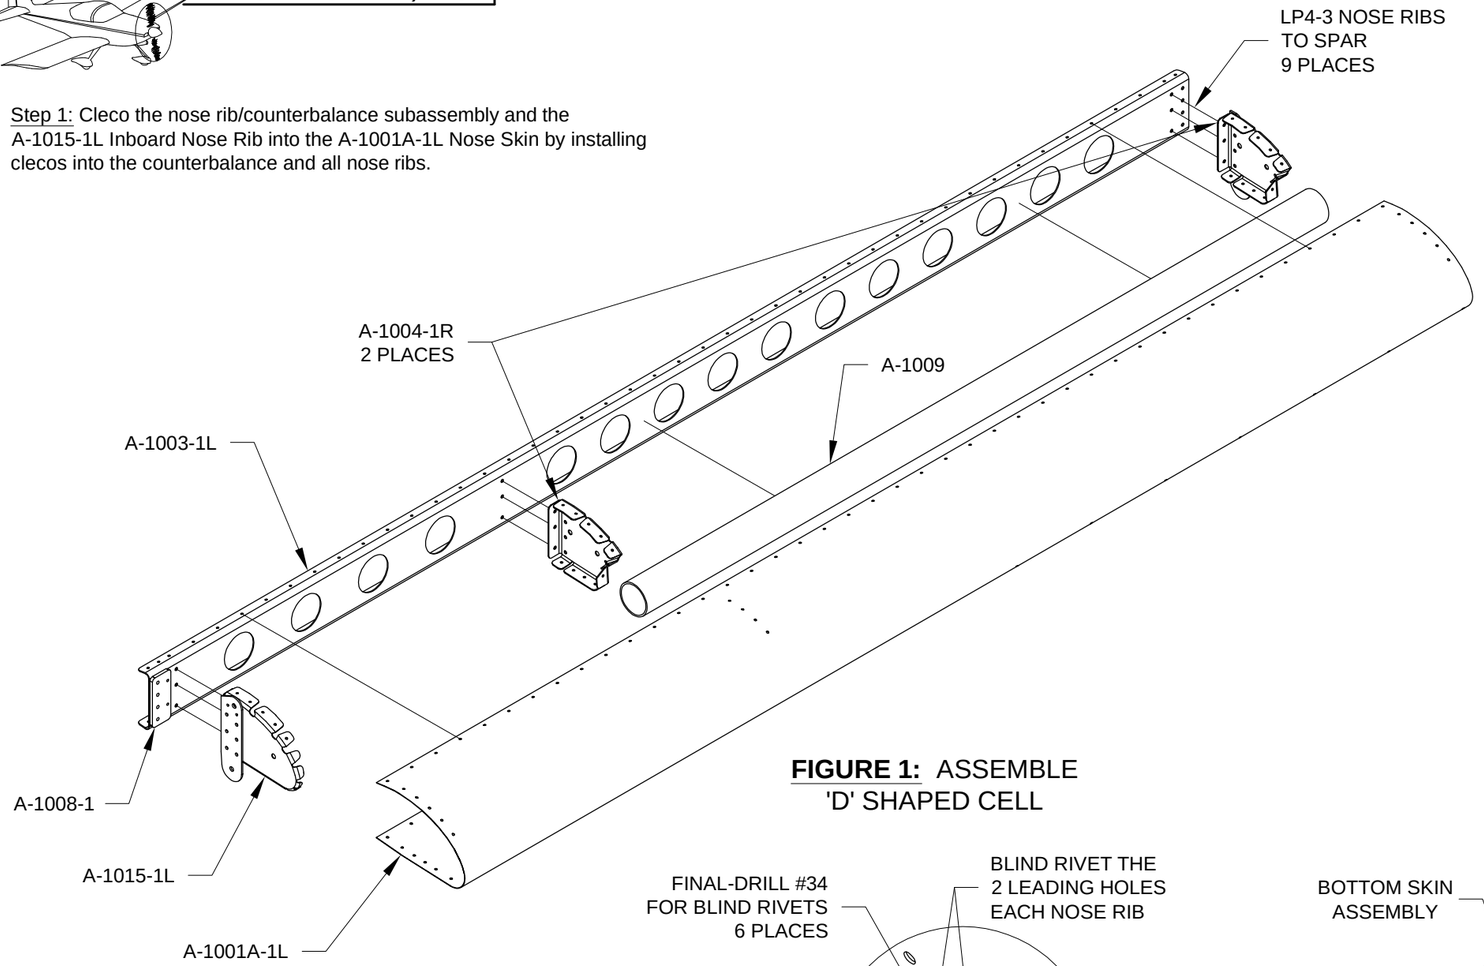

FIGURE 1: ASSEMBLE 'D' SHAPED CELL

CAUTION: Damage to the nose skin may result if solid rivets are substituted for the blind rivets shown in Figure 2.

Step 2: Rivet the A-1004-1R and A-1015-1L Nose Ribs to the A-1001A-L Nose Skin as shown in Figure 2. For rivet call outs see Page 21-09, Figure 2. The solid rivets can be set with a hand squeezer if a .500 [12.7 mm] tall set is used on the shop head side.

Final-Drill #34 the holes shown in Figure 2. Blind rivet the nose skin to nose rib holes as shown in Figure 2.

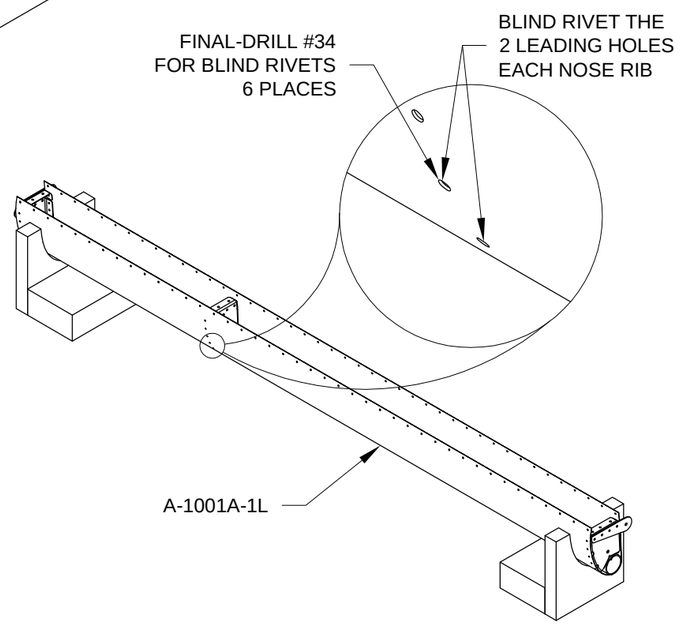

FIGURE 2: RIVETING NOSE SKIN

Step 3: Cleco the spar assembly to the A-1001A-1L Nose Skin and to the A-1004-1R Nose Ribs as shown in Figure 1. Cleco the spar assembly to the A-1015-1L Inboard Nose Rib.

Blind rivet the nose ribs to the A-1003-1L Spar using the rivets called out in Figure 1.

CAUTION: When reaching down between the skins with the bucking bar be especially careful in this confined area that the bucking bar is not driven into the top aileron skin while you are concentrating on the bottom.

Step 4: Remove the clecos from the top flange of the spar assembly and insert the top skin assembly.

Cleco the top skin assembly to the spar at every other hole. Clamp a straight board to the top skin near the trailing edge (to hold the top skin straight while riveting).

Rivet the top skin assembly to the spar (see Page 21-09, Figure 2 for all A-1001-1L Nose Skin rivets).

Rivet the A-1005A-1L and -1R Main Ribs to the spar using the rivets called-out in Figure 3.

Cleco then rivet the bottom skin assembly to the spar.

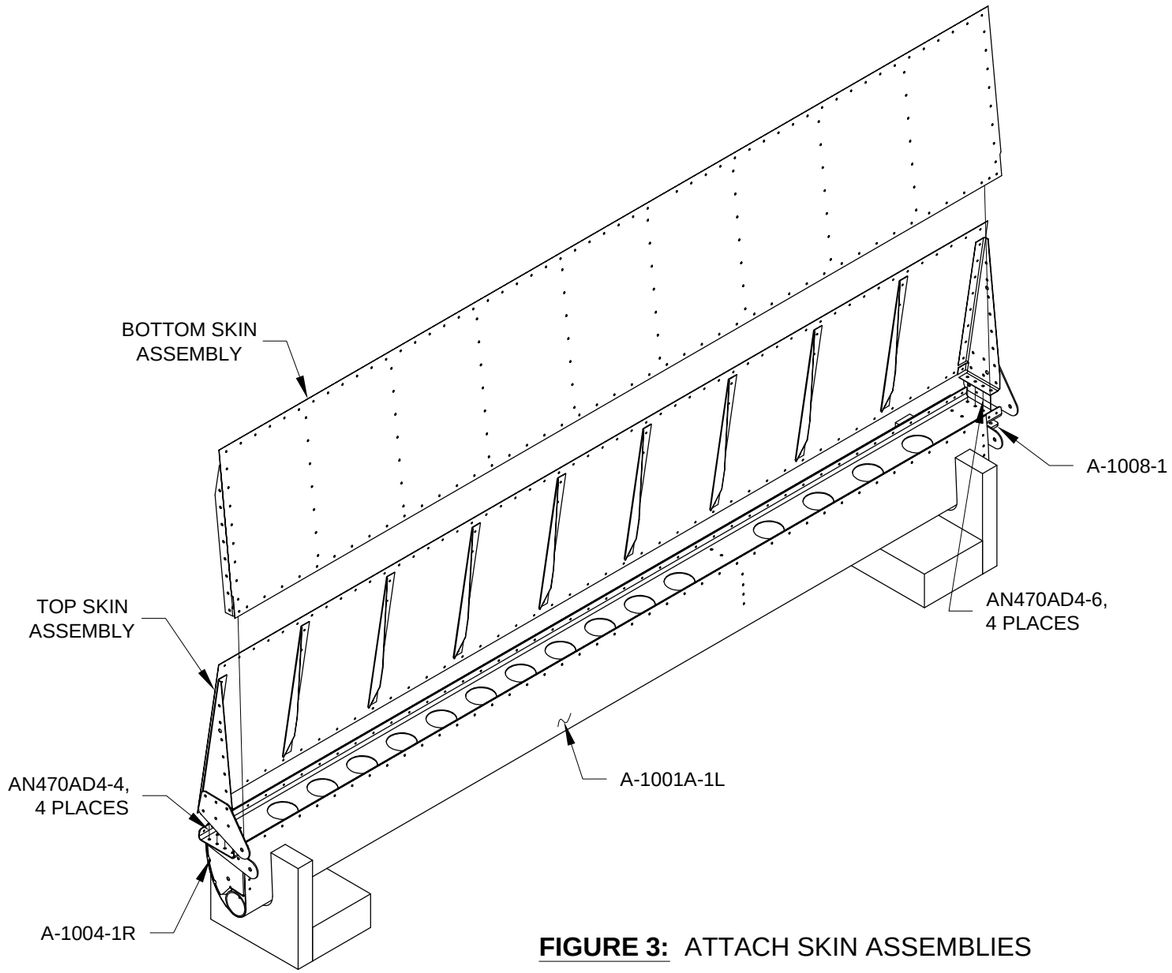

FIGURE 3: ATTACH SKIN ASSEMBLIES

Step 1: Cleco the A-1011-1 Trailing Edge into the assembly as shown in Figure 1.

Step 2: Cleco the A-1005A-1L and A-1005B-1L Main Ribs together. Cleco the A-1005A-1R and A-1005B-1R Main Ribs together then rivet all main ribs as shown in Figure 1.

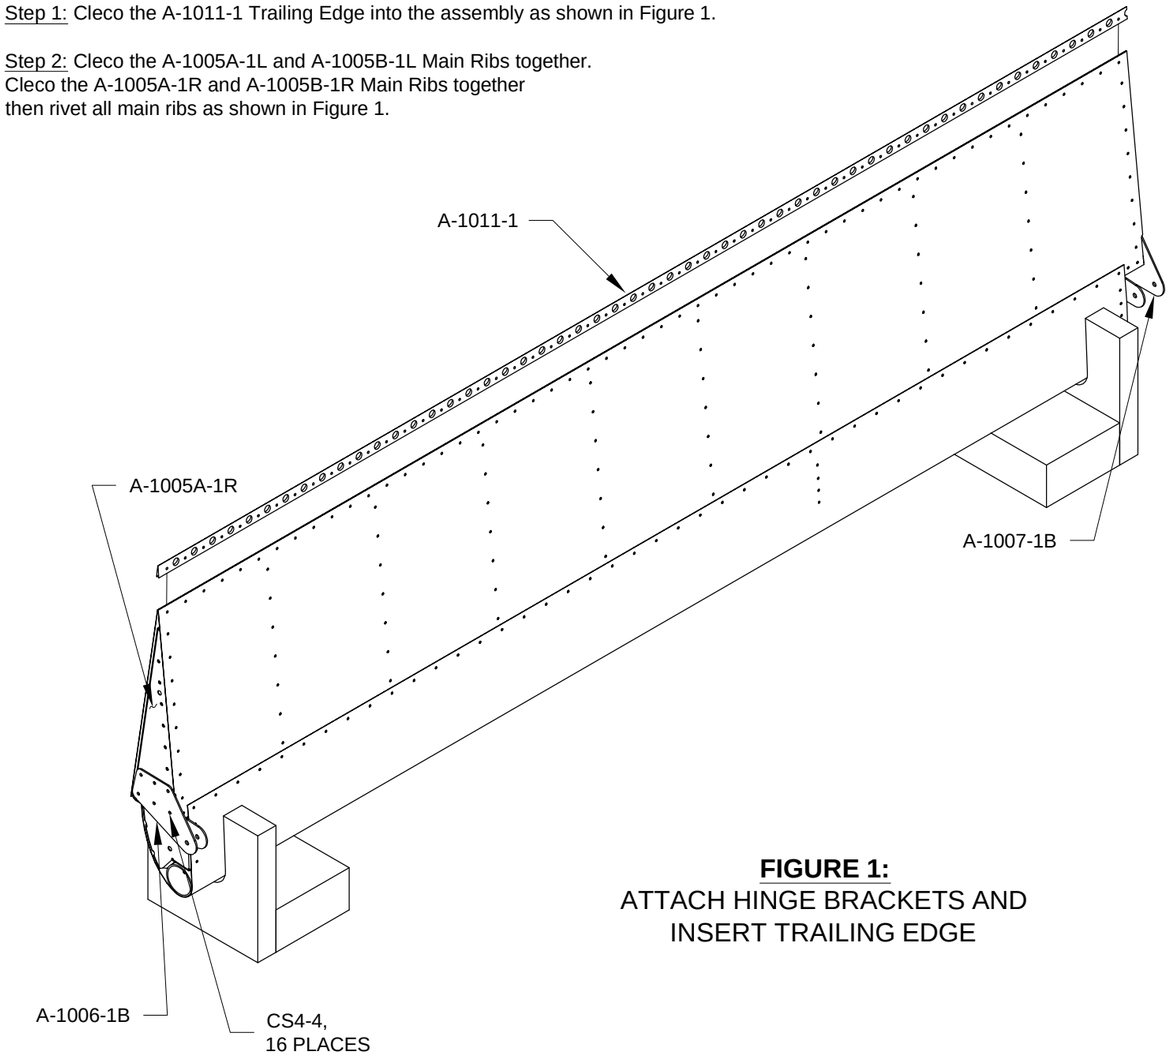

FIGURE 1:
ATTACH HINGE BRACKETS AND
INSERT TRAILING EDGE

Step 3: Remove the aileron assembly from the cradle and lay it on its top with the trailing edge clecos hanging over the edge of the table as shown in Figure 3. Blind rivet the A-1009 Counterbalance to the A-1001A-1L Nose Skin (see Figure 2 for rivet call-outs). For a nicer finish use a small hammer to tap the top and bottom edges of the blind rivet heads down flush to the skin so that the rivet head follows the tight radius of the leading edge.

Step 4: Turn the aileron over top side up.

Remove the A-1011 Trailing Edge as shown in Figure 1.

Complete the riveting of the aileron, refer to Section 5H for further instruction/technique. See Page 21-10, Figure 3 for trailing edge rivet call-outs.

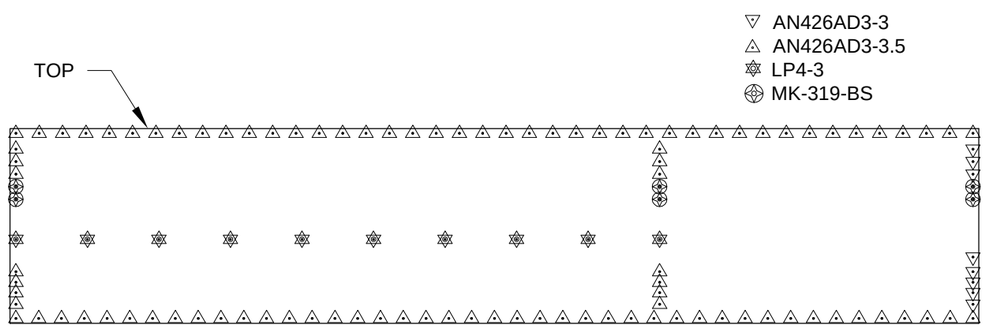

FIGURE 2: NOSE SKIN RIVETS

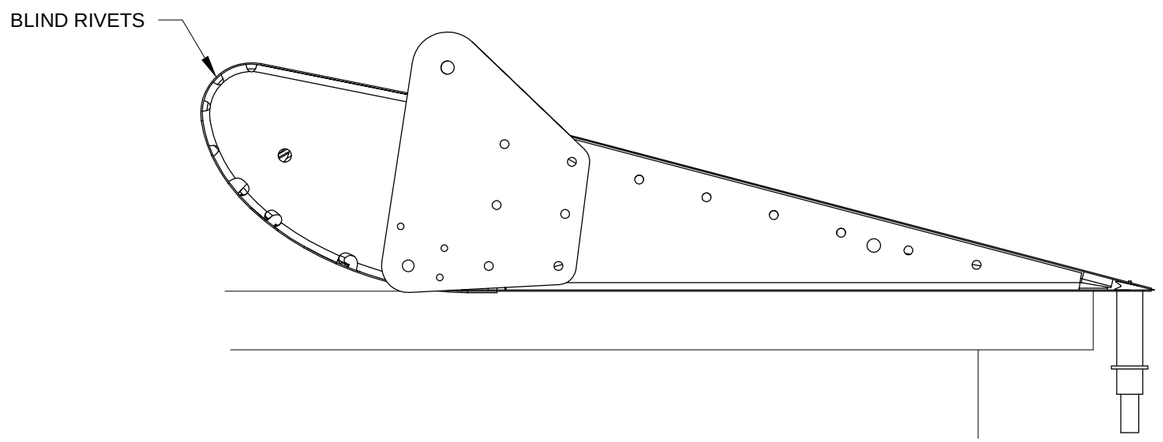

FIGURE 3: LEADING EDGE RIVETS

Step 1: The hardware called-out in Figure 1 for attachment of the inboard hinge bracket to the wing will be used during completion of the aileron actuation system as covered in Section 23.

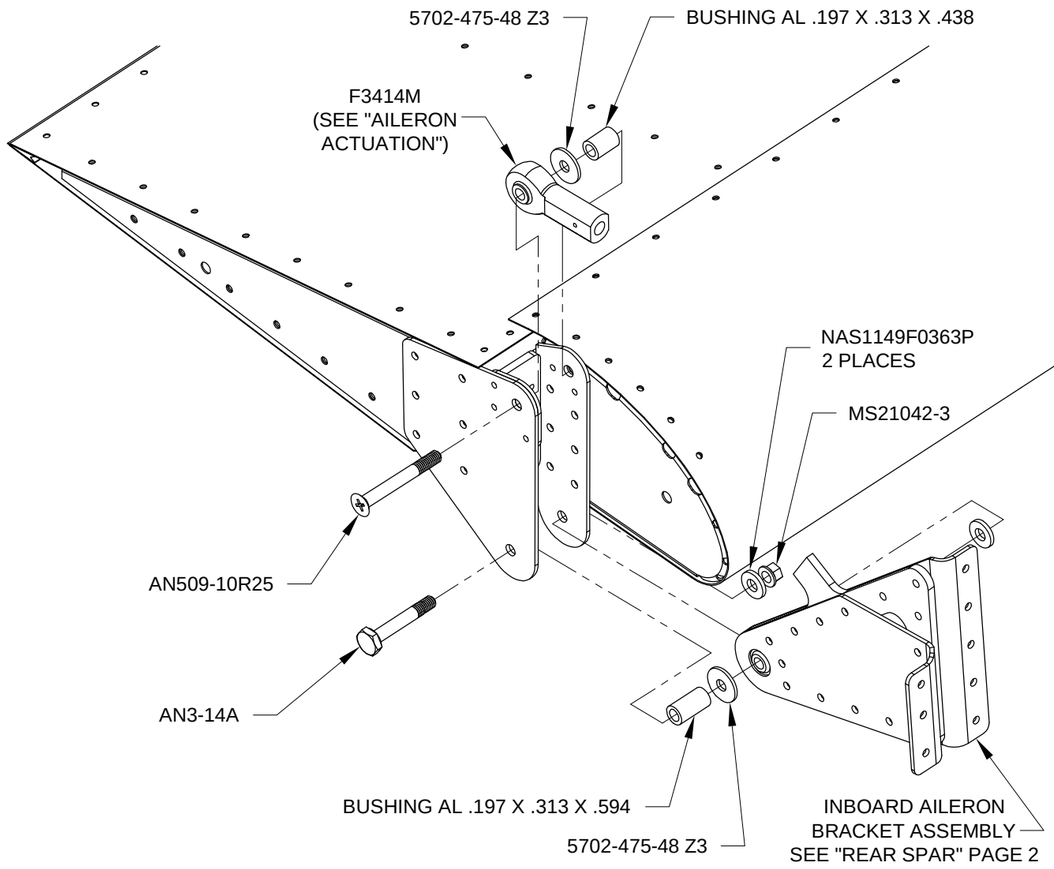

FIGURE 1: INBOARD HINGE BRACKET ATTACH HARDWARE

Step 2: The hardware called-out in Figure 2 for attachment of the outboard hinge bracket to the wing will be used during completion of the aileron actuation system as covered in the "Aileron Actuation" section of the manual.
